

# Ask your patients how tardive dyskinesia (TD) symptoms are impacting their life

---

It is important for patients to let you know how TD is affecting them. These questions are designed to help identify the impact of TD on their daily lives and help start a discussion about it.

## Psychiatric Stability

Involuntary movements have led to:

- Anxious or depressed feelings
- Feelings of distress, isolation, or loneliness
- Feeling embarrassed or hesitation to go out in public
- Frustration when interacting with family, friends, or coworkers

## Psychosocial State

Involuntary movements have led to difficulty with:

- Eating or drinking
- Getting dressed
- Personal hygiene
- Writing
- Work, hobbies, sports, or leisure activities
- Speaking or breathing

## Physical Health and Ability to Function

Involuntary movements have led to:

- Muscle pain or discomfort
- Pain or unusual sensations in your mouth or on your tongue
- Biting your tongue or cheek
- Problems with your teeth such as chipping or breaking

Please use silhouette to indicate the parts of your patient's body that they describe as affected by TD
